AN INFORMATION SHEET FOR SUPPORT PERSONS:

Type 1 diabetes in children and adolescents

what is type 1 diabetes?

Type 1 diabetes occurs when the pancreas is unable to make enough insulin. Insulin is a hormone that acts as a key to let glucose from the food we eat, pass from the blood stream into the cells to provide energy.

What are the symptoms?

In diabetes, glucose stays in the blood, causing the blood glucose level to become abnormally high. Symptoms may include:

- · Being very thirsty
- · Being very tired
- · Passing lots of urine
- Tummy pain
- Losing weight
- Feeling generally unwell
- · Being dehydrated

What causes type 1 diabetes?

Some people carry genes which might make them more likely to get type 1 diabetes. However, it only develops in these people when something triggers the immune system to destroy the insulin-producing cells in the pancreas. These triggers are thought to be factors in the environment, but as yet are not well understood.

Type 1 diabetes is treated by:

- Lifelong insulin by injection several times a day or via an insulin pump.
- Following a healthy eating plan including regular carbohydrate-containing foods.
- Being physically active on a regular basis.
- Testing blood glucose levels several times a day.
- Having regular medical check-ups with the diabetes team, that may include a diabetes specialist, diabetes educator, dietitian, social worker, psychologist.

Type 1 diabetes is usually diagnosed during childhood or young adulthood but can occur at any age. People with type 1 diabetes need insulin every day for survival, either by injection or insulin pump.
